U.S. Merchandise Trade

Exports and Imports—1965-76

Classified by BEA End-Use Commodity Categories

BUREAU OF ECONOMIC ANALYSIS

George Jaszi, Director

Allan H. Young, Deputy Director

**Jack J. Bame, Associate Director for
International Economics**

**Louis J. Moczar, Chief, Balance of
Payments Division**

This volume was prepared under the direction of **Louis J. Moczar**, Chief, Balance of Payments Division.

The planning and supervision of the compilation of the end-use statistics was the responsibility of **Howard Murad**, Chief, Merchandise Trade Branch. The staff contributors were:

D. Anne Fisher—reconstruction of trade series back to 1965 on a balance of payments basis.

Russell C. Krueger—derivation of constant dollar trade data and revisions of the seasonally adjusted series.

Irma H. Hawley and Rebecca E. Bethea—statistical assistance.

The tabular presentation was programmed for computer typesetting by **Virginia D. Vitarello**. Editorial service was provided by **Sybella Clayton G'Schwend**.

Appreciation is expressed to **Emanuel A. Lipscomb**, Chief, Foreign Trade Division, Bureau of the Census, and his staff for continuous cooperation over the years with BEA.

FOREWORD

The classification of exports and imports by end-use categories provided in this reference volume enables analysts to view changes in merchandise trade from the perspective of developments in specific demand segments.

For instance, the end-use category "automotive vehicles, parts, and engines" can be compared with the auto output measure in the gross national product and with the Federal Reserve Board's industrial production index for automotive products. The categories "consumer goods" and "capital goods" can also be compared with reasonable counterparts in the GNP and in the FRB index. Categories such as "foods, feeds, and beverages" and "industrial supplies and materials" are not directly related to any specific component of the major aggregate measures of economic activity. However, "industrial supplies and materials" does reflect changes in the total industrial production index. The "foods, feeds, and beverages" category is relevant to the farm component in the personal income account.

The Bureau of Economic Analysis (formerly Office of Business Economics) developed the system of end-use classification in the mid-1950's to enhance the usefulness of trade statistics compiled by the Bureau of the Census, which are organized by the physical nature of commodities and their stage of processing or by industry categories associated with their production.

Historical end-use statistics were first published in 1963. In 1970, restructured and revised end-use statistics were published in *U.S. Exports and Imports Classified by OBE End-Use Commodity Categories, 1923-1968*. Statistics presented in the latter are updated in the present volume, which also introduces several new series.

Presented here for the first time are end-use trade data on a balance of payments basis with developed countries, members of the Organization of Petroleum Exporting Countries, and other developing countries. Also new are constant-dollar series on merchandise trade by major end-use categories on a balance of payments basis. Statistics shown in this volume incorporate data corrections that have not been made elsewhere.

This volume will be indispensable to those who desire historical continuity, particularly because extensive revisions in the Census Bureau's trade classifications systems will go into effect with the publication of the January 1978 merchandise trade statistics. These revisions will have a negligible effect on the end-use series on a balance of payments basis; BEA will adjust the historical data to maintain continuity of the series published in this volume. Such adjustments will be published in the *Survey of Current Business*.

INTRODUCTION

This volume has four sections. The first two present U.S. exports and imports by principal end-use commodity categories globally and by geographic areas on (1) *Balance of payments basis trade*, and on (2) *Census basis exports (including military grant shipments) and imports*.

Section (3), *Constant (1972) dollar trade, balance of payments basis*, presents U.S. exports and imports by principal end-use categories. Section (4) presents *Unit value indexes (1972=100)* for exports and imports by principal end-use categories.

I. Statistical Base for Construction of End-Use Series

The Bureau of Economic Analysis (BEA) end-use series in this volume are constructed from basic data provided by the Bureau of the Census. The Census Bureau has the primary responsibility for compiling the official statistics of U.S. merchandise exports and imports and collects foreign trade data on the basis of some 14,000 individual commodity numbers. These commodity numbers are contained in commodity classification schedules: Almost 4,000 in Schedule B, for exports; over 10,000 in the Tariff Schedules of the United States Annotated (TSUSA), for imports.

BEA uses these 14,000 basic "building blocks" to construct 231 end-use commodity groups; 119 for exports, and 112 for imports. Each is identified by a 4-digit code number. (See "Outline of BEA End-Use Classification System for Exports and Imports, With End-Use Code Numbers", page ix.)

These 4-digit commodity groups are aggregated into broader, intermediate groups identified by 2- and 3-digit codes. Intermediate groups are aggregated into principal end-use categories identified by 1-digit codes. The principal 1-digit end-use categories—seven for exports, six for imports—are:

- Foods, feeds, and beverages
- Industrial supplies and materials
- Capital goods, except automotive
- Automotive vehicles, parts, and engines
- Consumer goods (nonfood), except automotive
- Special category (military-type goods)—exports only
- All other: Exports, n.e.c. and reexports; imports, n.e.s.

At the 1-digit level, the codes and descriptions for export and import categories of the BEA End-Use Classification System correspond. Special category exports is the exception. However, when more detailed commodity groups are used (2-, 3-, and 4-digit code numbers), the codes and descriptions no longer match because (1) The 2-, 3-, and 4-digit groups for each export and import end-use category were selected by the subgroup's value contribution to its parent end-use category and to total exports or imports, and (2) the commodity composition of U.S. exports differs substantially from that of imports. For example, under *foods, feeds, and beverages*, "grain and preparations" are shown separately for exports but not for imports; correspondingly, "coffee, cocoa, and sugar" are shown for imports but not for exports.

The assignment of the Census Bureau's 14,000 basic coded commodities to BEA end-use codes and, conversely, the content of each of the 231 BEA 4-digit end-use groups in terms of the Census Bureau's Schedule B (SITC) export commodities and TSUSA import commodities can be determined from the cross-classification schedules published by the Census Bureau; the latest edition, *U.S. Foreign Trade Statistics, Classifications and Cross-Classifications*, was issued in 1976.

II. Statistical Continuity

The historical series on U.S. exports and imports contained in this volume link up directly with data published on a current basis by the Bureau of Economic Analysis and the Bureau of the Census.

A. BEA Publications

Data by principal end-use categories and major geographic area—balance of payments basis—comparable to tables 1.2 and 1.3 in this volume, are shown in sections C and B, respectively, of table 3 of the U.S. international transactions article which appears quarterly in the March, June, September, and December issues of the *Survey of Current Business*. Also, data by principal end-use categories and selected summary commodity groups, Census basis, comparable to table 2.1 of this volume, appear in section D of table 3 in the quarterly *Survey* articles.

B. Bureau of Census Publications

In general, Census publications show data on U.S. merchandise exports and imports on a monthly and year-to-date basis. Data by end-use categories, comparable to table 2.1 of this volume, are shown in tables E-9 (exports) and I-5 (imports) of the Census Bureau's *FT-990—Highlights of U.S. Export and Import Trade*. End-use data by geographic areas, similar to those shown in table 2.2 of this volume, are shown in tables E-7 (exports) and I-8B (imports) of the monthly *FT-990*. However, the geographic areas shown in table 2.2 of this volume differ in a few cases from those shown in the *FT-990*. There are other Census materials offering varying degrees of commodity and geographic detail. The contents of Census publications relating to trade are outlined in *Guide to Foreign Trade Statistics, 1976*. Further information on Census Bureau publications can be obtained from the Trade Information Branch, Bureau of the Census, Room 2231, Federal Office Building 3, Washington, D.C. 20233.

C. Petroleum and Products Imports

In 1976, BEA changed the end-use definition of petroleum and products to conform with that of the Bureau of Mines. The change primarily involved the inclusion of propane and butane in the total for petroleum and products. In this volume, the new definition is used for all petroleum and products data. Although the Census Bureau had not yet incorporated this change in its end-use tabulations as this volume went to press, it is scheduled to do so in 1978. To obtain data comparable to those published here, users of Census publications should add "liquid petroleum gases" to "petroleum and products."

III. End-Use Concepts and Terminology

The Bureau of Economic Analysis combines the data into broad commodity categories that are associated with the principal users of the commodities. In contrast, the Bureau of the Census classifies the data in terms of the physical nature of commodities and the stage of processing or in terms of the principal industries producing the commodities.

Inasmuch as the BEA end-use categories are constructed from the Census Bureau's Schedule B (export) and TSUSA (import) classifications, the validity of the assignment of individual commodities to end-use categories is subject to the limitations of the Census classification system. The end-use classification of many commodities is somewhat arbitrary, since the determination of economic sectors which consume or use these commodities is subjective. The 14,000 basic "individual" commodities classified in Schedule B and TSUSA frequently represent no single commodity but rather a number of different items not separately classified. These items are related by their material content or general function, not necessarily by their end-use. This is especially true of "basket" classifications. For example, "rubber products, n.e.s." may include erasers and soap dishes for consumer use; and rubber flanges, rings, and valves for industrial use. In cases of this kind, the products comprising most of the monetary value of the "basket" commodity (based on advice of foreign trade commodity specialists) determine the end-use assignment. In another instance, the commodity "ball bearings" is a machinery part assigned to the export end-use category *capital goods, except automotive* even though it includes ball bearings of autos and trucks which, if they were separately identifiable, would be assigned to the end-use category *automotive vehicles, parts, and engines*.

A. Description of End-Use Classification

While end-use demand has determined the reclassification and regrouping of the Census Bureau's export and import commodity classification into BEA's principal end-use categories, other factors have affected the basic and intermediate commodity groups within the principal categories. Important among these, as mentioned earlier, is the magnitude of the value contribution of these subgroups to the parent end-use categories and to total exports and imports. Also, these subgroups describe the physical nature of the commodities and their stage of processing. The subgroups can be aggregated into several of the Census Bureau's classifications by economic class: Finished manufactures, crude and semimanufactured materials. In addition, the groups of agricultural goods will add to the total value of agricultural exports as defined and published by the U.S. Department of Agriculture. Finally, in the end-use category *consumer goods (nonfood), except automotive*, the groups can be identified as durables or nondurables. These groups are consistent with the durable and nondurable components of personal consumption expenditures in the GNP (after adjustment for consumption expenditures on foods, automobiles, and fuels).

1. Foods, Feeds, and Beverages

This category is comprised of food for human consumption including edible animals and animal feeds. It excludes work animals and animals for breeding, which are included in "materials associated with nondurable goods and farm output," a group within the *industrial supplies and materials* category (see A2.c. below.) Tobacco is not included in the foods category: Cigarettes, etc., are in the *consumer goods (nonfood)* category, while unmanufactured tobacco is considered to be an industrial material used in the manufacture of cigarettes and other tobacco products.

In the foods category under exports, a distinction is made between agricultural and nonagricultural commodities, but not under imports. The foods category, unlike the other principal end-use categories, does not distinguish between manufactured and unmanufactured commodity classes for either exports or imports. (See page vii for definition of "manufactured" and "unmanufactured.")

2. Industrial Supplies and Materials

This category encompasses crude and processed materials and supplies primarily associated with, or used in the goods-producing sectors of the

economy—manufacturing, farming, and construction. Both the export and import classifications separate manufactured from unmanufactured (see page viii). Agricultural and nonagricultural aggregates can be obtained for exports but not for imports.

Under imports, the *industrial supplies and materials* end-use category has five major intermediate groups:

- a. **Fuels and lubricants**—coal, petroleum, gas, and uranium (excluding petrochemicals which are grouped with chemicals). Although fuels and lubricants are associated partly with consumer goods as well as industrial supplies, it was not considered feasible to try to distinguish between fuel for home heating, and fuel for industrial heating and energy.

Fuels and lubricants group was established as an independent major subcomponent of the *industrial supplies and materials* category under exports and imports because of their magnitude in U.S. international trade and because of the difficulty of associating them with the output of nondurable, as distinguished from durable, goods.

- b. **Paper and paper base stocks**—pulpwood, woodpulp, and scrap materials for making paper; also paper products, mainly newsprint, but including kraft paper, paperboard, and similar products. Excluded are such paper products as stationery, which are allocated to the consumer goods end-use category (see A5. below). Subgroups in this category are "paper base stocks" and "newsprint and other paper products." The predominance of newsprint imports in the paper group plus the unique nature of the product were the reasons for establishing *paper and paper products* as a separate major component.

- c. **Materials associated with nondurable goods and farm output**—supplies and materials related to the manufacture of products considered to be nondurables. This group is constructed for imports only. Such goods as crude and processed textiles are included, but not those manufactured textile products—i.e., apparel and household furnishings—which are in the consumer goods category. Also included are unmanufactured tobacco, chemicals (except medicinals), hides and skins, undressed furs, soap and perfumery ingredients, etc. Seeds, fertilizer, farmwork animals and breeding animals, and eggs for hatching are included as materials associated with farm output.

- d. **Selected building materials, except metals**—lumber, plywood and veneers, stone, sand, cement, lime, glass (except automotive), asbestos, gypsum, millwork, molding, prefabricated structures, etc. Excluded are metals used in building (steel beams, copper tubing, wire, pipe, latches, and locks, etc.). This group is constructed for imports only.

- e. **Materials associated with durable goods output**—supplies and materials related to the manufacture of products defined as durables. Included are primary metals and metal shapes and fabricated metal manufactures for further assembly or incorporation with other goods (door hinges, latches, locks, and parts and components not included elsewhere). This group is constructed for imports only.

The allocation of individual commodities to the subgroups outlined above is based on end-use demand and not on the nature of the commodities from the production (supply) viewpoint; i.e., imports of primary rubber, a "nondurable" commodity, is classified under "materials associated with durable goods output." Because of its major end-use in the production of tires, it is grouped with such durable goods as motor vehicles (including tractors) and aircraft.

For exports, the *industrial supplies and materials* category distinguishes between agricultural and nonagricultural goods. As for intermediate groups: (a) *Fuels and lubricants* is the same as for imports; (b) *paper and paper base stocks* is not a major subgroup for exports. There are no intermediate groups for exports similar to import items (c), (d), and (e).

3. Capital Goods, Except Automotive

This end-use category includes all (nonmilitary) machinery, equipment, apparatus, and instruments—their parts, components, accessories, and attachments. These products are associated with investment outlays for industrial and agricultural plant and equipment; for commercial, scientific, professional, and service-industry capital goods; and for natural resource development (petroleum and mining) and construction. Also included is transport equipment—civilian aircraft and parts, railway rolling stock, and, for exports only, commercial cargo and passenger-carrying vessels. (The United States does not collect data on imports of such vessels since there is no provision for these in the official Tariff Schedules of the United States. Estimates are made, however, for balance of payments basis trade, as discussed on page xiii.) Automotive products are excluded from the capital goods end-use category as are other transportation items classifiable as *consumer goods* (yachts and other pleasure craft, motorcycles, etc.) (See A4. and A5. below.)

Note that in the Census Bureau's basic commodity classifications parts for military aircraft cannot be identified separately from other aircraft parts; consequently, exports of parts for both military and civilian aircraft are included in the *capital goods* category.

4. Automotive Vehicles, Parts and Engines

This category consists of commodities that might have qualified for assignment to two other end-use categories: *Consumer goods (nonfood)* and *capital goods*. However, because commodity descriptions do not distinguish personal autos from business autos and auto parts from truck parts, and because of the overall magnitude and importance of U.S. automotive trade, a separate *automotive* category was established. There are groups within the category for: Passenger cars; trucks and busses; and automotive parts and engines (including engine parts).

The data on imports of automotive vehicles from Canada are recorded by the Census Bureau in accordance with statutory valuation requirements of the Customs Bureau. However, it has been found that since 1965, the data on imports of automotive vehicles from Canada are overvalued in terms of actual transactions carried on the books of the U.S. parent, automotive companies (purchasers) and their Canadian manufacturing affiliates (sellers). Tables 2.1 and 2.2 of this volume show automotive imports from Canada valued at the Customs/Census statutory valuation for the years 1965-73, and at the f.a.s. transactions value for 1974-76. (See Technical Notes, page xiii.) Tables 1.2 and 1.3 have been corrected for this overvaluation. Exports of automotive vehicles to Canada are carried in the Census data at transactions value and, therefore, are not similarly overvalued.

The coverage of commodities identifiable as automotive parts in the Census Bureau's export statistics is less inclusive than the coverage of automotive parts in import statistics. The duty-free provisions of the United States-Canadian Automotive Trade Agreement of 1965 resulted in the establishment of a considerable number of new import commodity classifications for the proper identification and classification of duty-free automotive import items. Similar classifications identifiable as automotive were not established for exports. As a consequence, the official Census trade statistics as well as the data on the automotive end-use categories reported in this volume understate the value of exports of automotive parts and of total automotive exports in relation to corresponding imports. This understatement has largely been corrected in tables 1.2 and 1.3 (see Technical Notes, page xiii).

5. Consumer Goods (Nonfood), Except Automotive

This category, covering a broad variety of products used by the final consumer, has been subdivided into durables, nondurables; manufactured, unmanufactured. Included are consumer-type transportation equipment other than automotive—pleasure craft, motorcycles, etc.—and furniture, rugs, appliances, radios and television sets, clocks and watches, precious stones, and other durables; and apparel and household softgoods, leather, rubber and

consumer "capital goods" along with furniture and appliances. The *consumer goods* category consists predominantly of manufactured products, but also includes such unmanufactured items as gem stones, Christmas trees, nursery stock, and pet birds.

6. Special Category (Military-Type Goods)

This is an export category only. It includes military aircraft, engines, turbines, missiles and rockets, military trucks, warships, ordnance, and other military material classified confidential as to country of destination by the U.S. Department of Defense. A few other military items, currently of minor value, which are not classified as *special category*—military cars and buses—are included in the category *exports not elsewhere classified*.

As mentioned earlier, parts for aircraft (exports) are not separately identifiable for military and civilian aircraft. Thus, all aircraft parts have been included with civilian aircraft in the capital goods category. (See A3. above.) (See also Technical Notes, page xiii.)

Imports of military aircraft parts are included in the category *imports not elsewhere shown*. (See A7. below.) Other military imports are either minimal in value or are unidentifiable and are included—as appropriate—in other end-use categories.

7. Exports, N.E.C., and Imports, N.E.S.

This category consists of transactions and commodities not elsewhere classified or shown. *Exports, n.e.c.* include *reexports* (exports of foreign merchandise imported into the United States and then reexported with no significant change in form or content), low-value shipments (commodity detail unavailable), a few military items not classified as special category, and special transactions such as goods imported for repair and reexported. *Imports, n.e.s.* include low-value shipments; U.S. goods returned (after having been exported); military aircraft and parts (identified under duty rate provision 16: Government importation, exempt from duty); and movies, exhibits, and laboratory, zoo, and show animals, etc.

B. Description of Subclassifications

Major aggregates and subclassifications in the BEA principal end-use categories can also be rearranged by stage of processing and by sector.

1. Unmanufactured (or Unfinished) and Manufactured (or Finished)

The term *unmanufactured* (or "unfinished"), as used in this volume, covers both "crude materials" and "semimanufactures," and is defined in the Census Bureau's subsidiary classification of commodities by economic classes. The term *manufactured* (or "finished") is synonymous with the Census economic class "finished manufactures."

The end-use category *industrial supplies and materials* is composed of both unmanufactured (crude materials and semimanufactures) and manufactured (finished manufactures) commodity groups. Each commodity group at the 4-digit code level within this category belongs to one of these "stage of processing" economic classes. All the other nonfood end-use categories—with the exceptions noted below—are composed entirely of goods classified as manufactured (finished manufactures). The *foods, feeds, and beverages* category does not distinguish between crude and manufactured foods. The *consumer goods (nonfood)* category is predominantly composed of manufactured goods, with certain exceptions as noted in A5. above. The "all other" categories *exports, n.e.c.* and *imports, n.e.s.* are considered to be wholly "finished manufactures" although, in fact, commodity identifications are not available for all of the miscellaneous and special transactions in these "basket" categories.

Linking semimanufactures with crude materials rather than with manufactured goods indicates the close identification with primary materials

demand, plus the increasing tendency to import such semimanufactured materials. That tendency reflects the growing capability and preference of the primary producing countries to process crude ores—copper, lead, zinc, etc.—and to export them in smelted and refined forms as well as in semimanufactured shapes.

The Census Bureau definition of "finished manufactures," used in this volume, covers not only final products (and their parts and attachments)—capital goods, military equipment, automotive products, and consumer commodities (nonfood)—but also industrial supplies and materials which have reached an advanced stage of processing short of fabrication into final products. Thus, raw

textiles, fiber, thread, and yarn are "crude or semimanufactured goods," but textile cloth and fabrics are "finished manufactures" because they are ready to be manufactured into consumer products (apparel, upholstered furniture, curtains and drapes, etc.).

For users who wish to convert BEA's export and import end-use categories and related commodity groups into stage-of-processing economic classes as described above, the following BEA code numbers are provided as a key. (For abbreviated commodity descriptions of code numbers, see "Outline of BEA End-Use Classification System for Exports and Imports, With End-Use Code Numbers," page ix.)

2. Agricultural Exports and Imports

The commodity groups identified as agricultural within the end-use export category scheme are made up of those individual Schedule B commodities defined as agricultural by the U.S. Department of Agriculture. They aggregate to the total value of agricultural exports as published by the U.S. Department of Agriculture in its monthly *Foreign Agricultural Trade of the United States*. Agricultural commodities include:

- Animal and animal products**—meat and poultry, dairy products and eggs, hides and skins, raw wool, animal oils and fats.
- Products of the soil**—grain (including cereal preparations); oilseeds (and oils); fruits, vegetables, and their juices (including frozen, canned, or preserved); coffee, cocoa, sugar, tobacco, and raw natural fibers such as cotton, jute, flax, etc.
- Natural and fermented ales and beverages.**
- Miscellaneous commodities such as those tapped from trees**—crude natural rubber, maple syrup. (However, forestry prod-

ucts in the form of raw wood, logs, and lumber are considered nonagricultural.)

Marine foods (fish and products) are considered nonagricultural as are earth-extractive commodities—fuels, metals, and minerals. Agricultural products which have gone through a considerable degree of manufacture are classified as nonagricultural. Thus, hides and skins are agricultural, but leather and shoes are nonagricultural. Similarly, raw cotton, wool, flax, etc. are agricultural but textiles and apparel are not. Raw tobacco is agricultural, but cigarettes are not. Fermented beverages such as cider, wine, and beer are agricultural, but distilled alcoholic "hard" beverages and formulated, carbonated colas and sodas are not.

Agricultural commodity groups are found in only three of the principal end-use categories: *Foods, feeds, and beverages*; *industrial supplies and materials*; and *exports, n.e.c. and reexports* (reexports of agricultural products of foreign origin). (See "Outline of BEA's End-Use Classification System," page ix.) These three categories also include nonagricultural commodity groups, but all other categories are comprised exclusively of nonagricultural goods.

Unlike agricultural exports, agricultural imports cannot be separately identified from the end-use categories. The totals published in table 1.2, therefore, are based on the U.S. Department of Agriculture definition of agricultural imports and published by the Bureau of the Census in the FT-990.

OUTLINE OF BEA END-USE CLASSIFICATION SYSTEM FOR EXPORTS AND IMPORTS, WITH END-USE CODE NUMBERS

EXPORTS		IMPORTS	
End-Use Code #	Abbreviated Description	End-Use Code #	Abbreviated Description
0	FOODS, FEEDS, AND BEVERAGES	0	FOODS, FEEDS, AND BEVERAGES
00	Agricultural	00	Green coffee, cocoa beans, and cane sugar
000	Food and feed grains	000	Ditto

5	IMPORTS, N.E.S.
50	Ditto
500	Ditto
5000	Military aircraft and parts
5002	U.S. goods returned, minimum value shipments, movies, etc.

TECHNICAL NOTES

U.S. merchandise trade statistics in this report are based on data compiled and published by the Census Bureau. BEA adjusts these data to balance of payments concepts. (See table A, p.xiv.) Outlined below are Census methods and the various adjustments applied by BEA.

I. Census Export Statistics

Census export statistics record the physical movement of domestic and foreign merchandise from the U.S. Customs territory (i.e., the 50 States, the District of Columbia, and Puerto Rico) to foreign countries. Exports of domestic merchandise include commodities which are grown, produced, or manufactured in the United States, and commodities of foreign origin which have been changed in the United States from the form in which they were imported or which have been enhanced in value by further manufacture in the United States. Examples of commodities considered to be domestic for statistical purposes when exported to a foreign country are: Sugar refined in this country from imported raw sugar, flour ground from imported wheat, and metal smelted or refined from imported ores or scrap. Further, when materials or parts of foreign origin are imported into the United States and incorporated with material or parts produced in the United States, the complete product is considered to be a domestic product and the imported parts lose their identity as foreign merchandise. Exports of foreign merchandise consist of commodities of foreign origin which have been entered into the United States as imports and which, at the time of exportation, are in substantially the same condition as when imported.

Also included in Census export statistics are military grant-aid shipments under the Military Assistance Program (MAP) of the U.S. Department of Defense. Although the total value of shipments under these programs is known, such shipments are not separately identifiable on an individual commodity basis in the trade statistics shown in tables 1.2, 2.1, and 2.2 of this volume.

Census statistics prior to 1968 exclude exports of silver ore and bullion. For historical comparability, these exports have been added to the Census totals for the 1965-67 period.

The value reported in the export statistics generally is equivalent to the f.a.s. (free alongside ship) value at the U.S. port of export, based on the transaction price, including inland freight, insurance, and other charges incurred in placing the merchandise alongside the carrier at the U.S. port of exportation. The value, as defined, excludes the cost of loading the merchandise aboard the exporting carrier and also excludes freight, insurance, and any other charges or transportation costs beyond the port of exportation. However, it is recognized that the statistics may not always reflect the value as defined above, as exporters sometimes find it difficult to assign a value in accordance with this definition. This is especially true for truck and rail shipments to Canada. (See below under balance of payments adjustments.)

II. Census Import Statistics

In general, Census import statistics record the physical movement of merchandise into the U.S. Customs territory. Imported merchandise is reported as "general imports" and "imports for consumption." General import

statistics, shown in this report, include all arrivals of imported merchandise into the United States during a given period. Imports for consumption represent that portion of general imports which, on arrival, is immediately cleared through U.S. Customs. The difference between the two sets of data represents the value of merchandise placed in a bonded Customs warehouse.

As with exports, Census import statistics prior to 1968 exclude imports of silver ore and bullion. In this report, these have been added to the Census totals for the 1965-67 period.

The Census Bureau currently reports three values for import statistics: F.a.s., Customs, and c.i.f. The f.a.s. (free alongside ship) value, reported since 1974 is the transaction value of imports at the foreign port of exportation. It is based on the purchase price; i.e., the actual transaction value, and generally includes all charges incurred in placing the merchandise alongside the carrier at the port of exportation in the country of exportation.

The "Customs value," the only value published prior to 1974, is the value of imports as appraised by the U.S. Customs Service in accordance with the legal requirements of Sections 402 and 402a of the Tariff Act of 1930, as amended. Customs value may be based on the foreign market value, export value, constructed value, American selling price, etc. This valuation is used primarily for collection of import duties and frequently does not reflect the actual transaction value.

Both the f.a.s. and Customs valuations generally represent a value in the foreign country, and, therefore, exclude U.S. import duties, freight, insurance, and other charges incurred in bringing the merchandise to the United States.

The c.i.f. (cost, insurance, and freight) value, reported since 1974 represents the value of imports at the first port of entry in the United States. It is based on the purchase price and includes all freight, insurance, and other charges (excluding U.S. import duties) incurred in bringing the merchandise from the country of exportation and placing it alongside the carrier at the first port of entry in the United States. If the merchandise is acquired in a transaction between related parties, the purchase price used in deriving the c.i.f. value is estimated on the basis of an arm's length equivalent transaction price; i.e., a price which would be agreed upon by unrelated buyers and sellers. This may not be the actual transaction value.

For balance of payments basis trade, f.a.s. valuation is preferable since this valuation is most consistent with balance of payments concepts. Prior to 1974, therefore, attempts were made to approximate an f.a.s. value. (See below page xiii.)

III. Balance of Payments Adjustments to Census Data

The balance of payments adjustments made by BEA to the Census data fall into four categories: Timing, coverage, valuation, and geographic distribution.

A. Timing Adjustments

The principal adjustment involves the inclusion in Census statistics for a current month, transactions which belong in prior months' data. These transactions may not have been included in the proper month because: (1) They were reported in a statistically faulty manner and could not be corrected

in time for inclusion in the proper month, or (2) documents were transmitted to Census too late to be processed in the appropriate month. BEA shifts the value of these transactions from the current month to the previous month. (Most of the transactions occur in the immediately preceding month; an unknown but small portion falls in earlier months.) In 1976, the value of carryover documents in the Census current month totals averaged 3 percent for exports and 7 percent for imports.

Data are not available to allocate these timing shifts to end-use categories for table 1.2; therefore, they are included in "All other, including balance of payments adjustments, n.e.c." However, timing adjustments are distributed by major geographic areas, and are reflected in table 1.3.

B. Coverage Adjustments

A number of coverage adjustments are made affecting both exports and imports.

1. Nonmonetary Gold

Exports and imports of nonmonetary gold are excluded from Census merchandise trade statistics, although Census tabulates the statistics and publishes them as a "Special Announcement" in the FT-990.¹ BEA includes the nonmonetary gold transactions recorded by Census, as well as unrecorded U.S. receipts of gold from transfers or sales to U.S. private residents by foreign official agencies from their official holdings at the Federal Reserve Bank of New York.

In addition, the value of gold imports in 1976 includes some of the gold sold by the International Monetary Fund in a series of auctions. To the extent that part of the auctioned gold came out of foreign holdings at the Federal Reserve Bank of New York and was not purchased by foreign official agencies, it was treated as an import. Some of these gold imports were later exported; these were included in the export statistics in the appropriate time period.

Nonmonetary gold transactions are added to the end-use category *industrial supplies and materials* in table 1.2 and are distributed among major geographic areas in table 1.3.

2. Virgin Islands

Trade of the Virgin Islands with foreign countries, excluded from Census statistics, is included in the balance of payments basis data. Virgin Islands exports, which amounted to \$73 million in 1976, are distributed among the major geographic areas shown in table 1.3. About half of total Virgin Islands exports are shipments of alumina, which are included in end-use category *industrial supplies and materials* of table 1.2. The balance is composed of miscellaneous items, which are included in "All other, including balance of payments adjustments, n.e.c."

To meet the needs of a major oil refinery, Virgin Islands petroleum imports have grown significantly in recent years. Petroleum imports accounted for 97 percent of the 1976 total Virgin Islands imports of \$2,470 million. In table 1.2, petroleum imports are added to the end-use category *industrial supplies and materials* and the subgroup "petroleum and products." Bauxite accounts for about 30 percent of nonpetroleum imports into the Virgin Islands, and is included in *industrial supplies and materials*; other nonpetroleum imports are in "All other, including balance of payments adjustments, n.e.c." As is the case with exports, Virgin Islands imports are distributed among the major geographic areas shown in table 1.3.

3. U.S. Military Agency Transactions

Exports and imports by U.S. military agencies, included in Census statistics, are excluded from the balance of payments basis merchandise trade data. The exclusion is necessary in order to avoid double-counting of information included in other accounts in the statistical presentation of U.S. international transactions. In 1976, \$2,975 million for exports and \$299 million for imports were excluded from the annual statistics reported by Census. These data are distributed by area and, therefore, are reflected in the figures published in table 1.3 of this report. However, as it is not possible to allocate the data among end-use categories, they are included in "All other, including balance of payments adjustments, n.e.c."

4. Gift Parcel Post

Parcel post exports and imports by individuals are not covered by Census statistics, and estimates of the value of such imports are not prepared. Values of exports are estimated from data provided by the U.S. Postal Service and sampling surveys conducted at a U.S. Postal Service bulk mail center. Data derived in this manner are added to Census export statistics and are distributed by major geographic area in table 1.3. By end-use categories of table 1.2, they are included in "All other, including balance of payments adjustments, n.e.c."

5. Other Coverage Adjustments

Other adjustments to exports and imports include the addition of electrical energy (to and from Canada and to Mexico); sales and purchases of vessels; deductions of exports and imports between the Panama Canal Zone and the United States Customs territory; deductions from exports of exposed movie film for rental rather than sale; and deductions from imports of the amount spent in foreign ports to repair U.S. vessels. Vessel exports are partly included in Census statistics, but there is some undercounting. The major reason for the undercounting is that sales or transfers to foreigners can occur without physical movement of the vessel, which may or may not be in U.S. territory at the time of sale or transfer. Vessel imports are excluded from Census statistics.

C. Valuation Adjustments

1. Change to F.A.S.

As mentioned above, Census has reported imports on a transaction value basis at the foreign port of exportation since 1974. That series is currently used by BEA. Previously, Census reported imports only on the Customs value basis, necessitating adjustments by BEA for major known differences between the Customs value and the transaction value. The largest were downward adjustments for automotive vehicle imports from Canada. The downward revision is reflected in both tables 1.2 and 1.3. The change in total balance of payments basis imports resulting from the shift in valuation was quite small in 1974—a \$0.1 billion reduction. Although changes in the components, as presented in tables 1.2 and 1.3 were somewhat more extensive, comparability of the data is not seriously affected.

2. U.S. Inland Freight to Canada

Exports, like imports, are generally valued on f.a.s. basis. However, exports to Canada present a special problem in that export declarations filed by U.S. shippers often reflect prices f.o.b. plant. Total balance of payments basis exports to Canada (table 1.3) include an amount to correct for the

¹ Beginning in 1978, Census began to include nonmonetary gold transactions in its regularly published trade data.

undervaluation. The size of the adjustment is based on a sample survey conducted in 1969 by the Census Bureau. This adjustment is included in "All other, including balance of payments adjustments, n.e.c." of table 1.2.

3. U.S.-Canada Trade Reconciliation

The U.S.-Canadian Trade Statistics Committee was set up in December 1971 to reconcile on a regular basis the discrepancy between the U.S. and Canadian estimates of the movements of goods between the two countries. The results of the Committee's work have been incorporated into the balance of payments basis trade shown in tables 1.2 and 1.3 beginning in 1970. In 1976, net additions to exports amounted to \$1,546 million and net deductions from imports were \$98 million.

D. Geographic Distribution Adjustment

A portion of the grain exported abroad from the United States is transshipped through Canadian warehouses. In its published statistics, Census reports the shipments to the warehouses as exports to "unidentified countries." Based on U.S. Department of Agriculture reports on movements out of Canadian warehouses, BEA distributes these shipments to the country of destination. The statistics also are affected by the lag between the time the grain moves into the warehouses and the time it leaves.

A related adjustment involves transshipments through ports in West Germany, the Netherlands, and Belgium, shown in Census statistics as exports to these countries. Again, based on U.S. Department of Agriculture reports, BEA distributes these exports to the country of destination.

Adjustments described in this section are illustrated in the following table.

Table A.—Reconciliation of Census and Balance of Payments Merchandise Trade, 1976

[Millions of dollars]

Balance of payments adjustments to Census trade data	1976
EXPORTS	
Merchandise exports, Census basis, including reexports and excluding military grant shipments	114,802
Adjustments:	
Private gift parcel remittances	86
Virgin Island exports to foreign countries	73
Gold exports, nonmonetary	353
Inland U.S. freight to Canada	659
U.S.—Canadian reconciliation adjustments n.e.c. net	1,546
Merchandise exports transferred under U.S. military agency sales contracts identified in Census documents	-2,975
Other adjustments, net (including net timing adjustments, addition of electric energy; deduction of exposed motion picture film for rental rather than sale; deduction of exports to the Panama Canal Zone; net change in stock of U.S. owned grain in storage in Canada; and vessel exports not included in Census statistics.)	150
Equals: Merchandise exports, adjusted to balance of payments basis, excluding "military" ..	114,694
IMPORTS	
Merchandise imports, Census basis (general imports)	120,678
Adjustments:	
Virgin Islands imports from foreign countries	2,469
Gold imports, nonmonetary	939
U.S.—Canadian reconciliation adjustments, n.e.c., net	-98
Merchandise imports of U.S. military agencies identified in Census documents	-301
Other adjustments, net (includes net timing adjustments, addition of electric energy; deduction of foreign charges for repair of U.S. vessels abroad; deduction of imports from the Panama Canal Zone; and vessel imports not covered by Census statistics.)	327
Equals: Merchandise imports, adjusted to balance of payments basis, excluding "military" ..	124,014

IV. Seasonal Adjustments

A. The Adjustment Process

As with most economic series, merchandise trade data are subject to seasonal variation; i.e., within-the-year movements resulting from weather conditions, model changeovers, vacations, holidays, and similar factors. These intrayear patterns are combined with the underlying growth or decline and cyclical movements of the series, as well as random irregularities. The X-II program, used in this report to derive seasonal factors, decomposes a time series into these seasonal, trend, cyclical, and irregular movements. The program uses the ratio-to-moving average technique. A long-term moving average of the original series is computed to isolate the trend and cyclical movements. The original series is then divided term by term (month by month or quarter by quarter) by the moving average, yielding a series of ratios, which reflect basically seasonal and short-term erratic movements. Taking a moving average of these ratios for each calendar month or quarter separately (all Januaries, all Februaries, all first quarters, etc.) smoothes out the erratic movements, resulting in a series of ratios which reflect the seasonal variations of the series.

A full description of the X-II procedure is contained in the *Technical Notes on New Census Method for Seasonal Adjustment of Foreign Trade Data*, August 1969. Additional information regarding methodology may be obtained by writing the Foreign Trade Division, Bureau of the Census, Washington, D.C. 20233.

B. Derivation of Seasonally-Adjusted Data

For total exports and imports, both on the Census basis and the balance of payments basis, the quarterly seasonally adjusted data are the sum of the three months published by the Census Bureau. For end-use categories and major geographic areas, quarterly seasonal adjustment factors were derived by using the quarterly variant of the X-II program.

Quarterly seasonally adjusted data presented in this volume have been forced to the annual totals for each category and area. Further, these seasonally adjusted data for end-use categories and major geographic areas differ slightly from those published in issues of the *Survey of Current Business* before June 1977 because, for this report, the seasonally adjusted factors were derived using the historical series 1965-76. Factors for total exports and imports were left unchanged in accordance with Census practice of revising only the preceding year.

Except for imports of petroleum and products, factors for all series were derived from current dollar data.

C. Seasonal Factors for Petroleum and Products

Two events have affected the reliability of seasonal factors for petroleum and products. The first is the fourfold increase in prices at the end of 1973, and the second is the embargo on shipments to the United States by Arab oil exporting countries in late 1973 and early 1974. These two factors distorted the level of petroleum imports in 1974 and 1975. To meet the problem of price increases, a quantity series was used instead of the usual value series. The problem of the embargo required special analysis, whereby estimates of normal import demand from the fourth quarter of 1973 to the fourth quarter of 1975 were used, instead of the actual quantities imported during this period. As a result of these two modifications, seasonal adjustment factors were derived that were relatively free from major distorting influences.

V. Constant (1972) Dollar Data

Constant (1972) dollar data for the end-use categories shown in table 3.1, were derived primarily by using the Census Bureau's unit value indexes to deflate the current dollar series. The only exceptions were the unit value index series for petroleum and nonpetroleum imports prior to 1972. These were calculated by BEA using a method similar to that used by Census.

It should be emphasized that unit value indexes only approximate price movements by measuring changes in the quantity and value of commodities; they are not price indexes. Thus, they can give only an indication of price changes and, consequently, of changes in constant dollar trade.

Census unit value indexes are based on the Fisher index, which is the geometric mean of the Paasche and Laspeyre indexes. The Paasche index, the current year-weighted component of the Fisher index, is computed by using current year quantity weights; the Laspeyre index, the preceding year-weighted component of the Fisher index, uses preceding year quantity weights. The Fisher index, therefore, provides a measure of price change by using a combination of weights from the preceding and the current period.

The Fisher index for any year is "chained" to the index for the preceding year. Chaining is accomplished by multiplying the index for each commodity

by the corresponding index for the preceding year. The base is shifted thereby from the preceding year comparison period to the common or nominal base used for the time series.

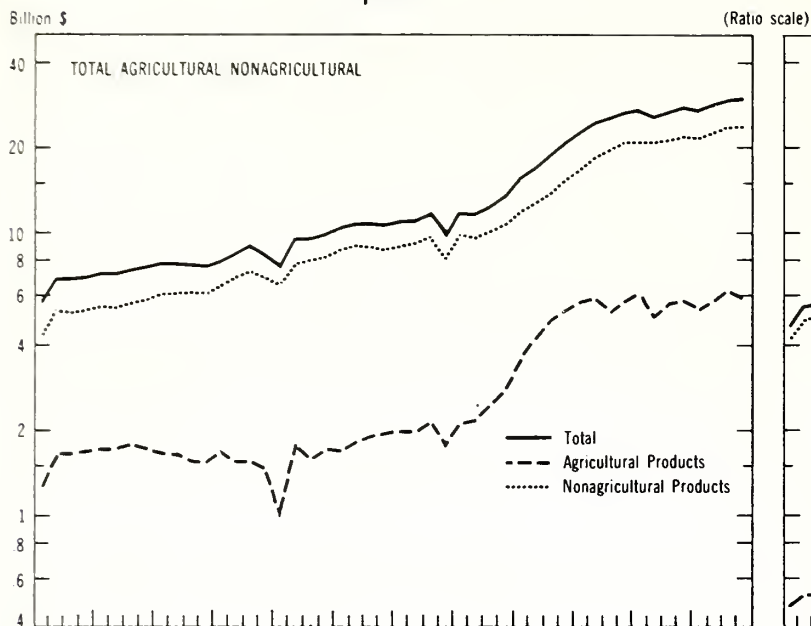

A more complete description on the methodology used can be obtained from *Index of U.S. Exports and Imports by Economic Class: 1919 to 1971*, published by the Bureau of the Census in 1972, or by writing directly to the Foreign Trade Division, Bureau of the Census, Washington, D. C. 20233.

Currently, most Census unit value indexes are based 1967=100, and are updated regularly in table 9 of FT-990. In this volume, the base year has been changed to 1972=100.

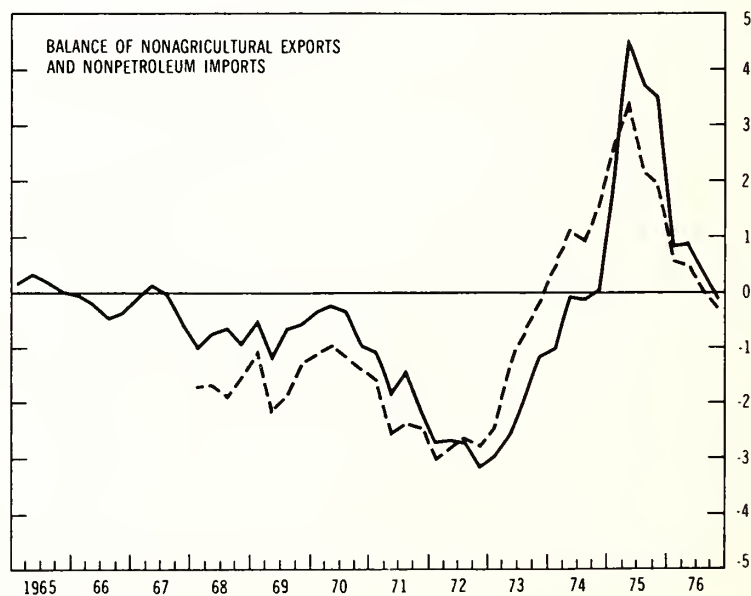

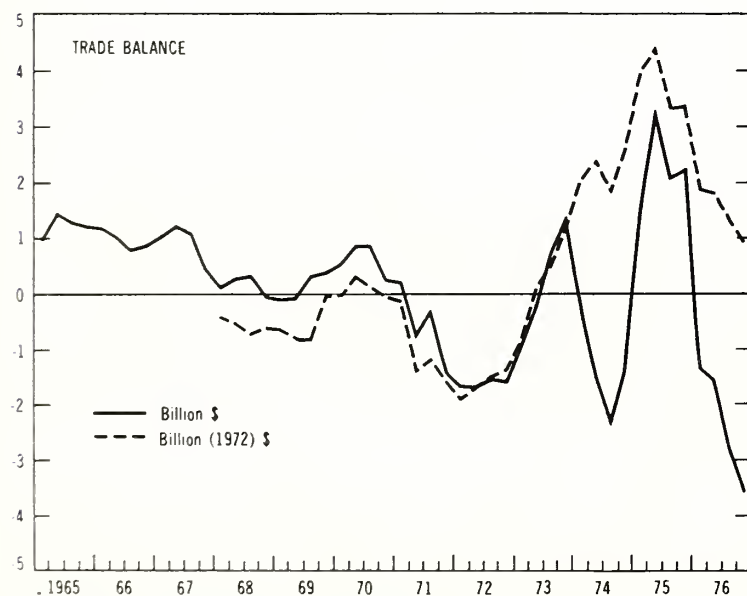

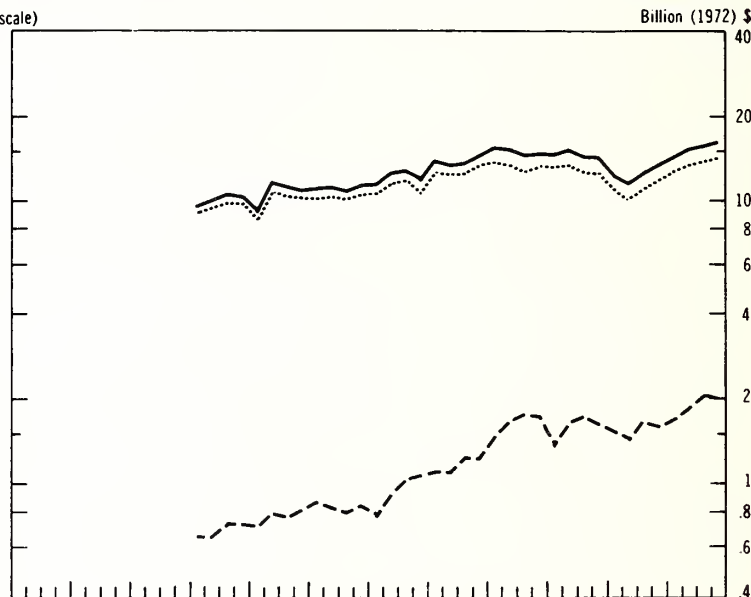

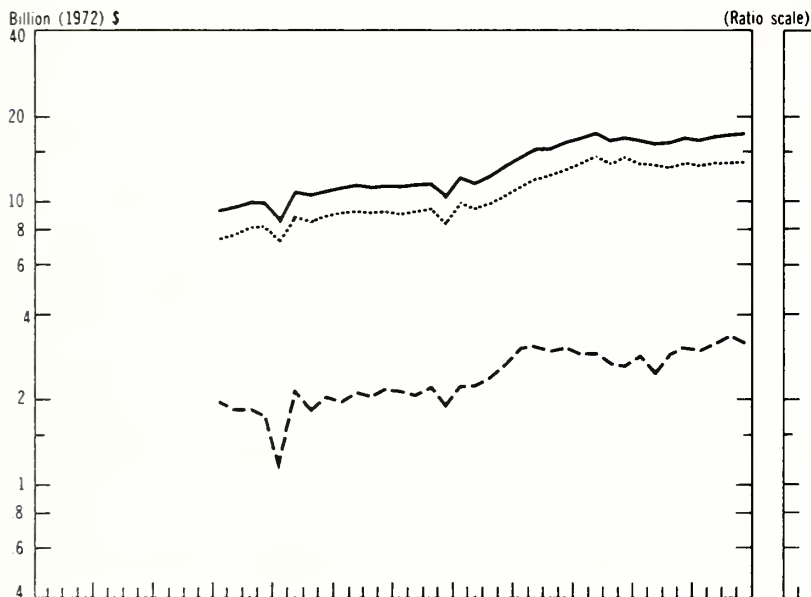

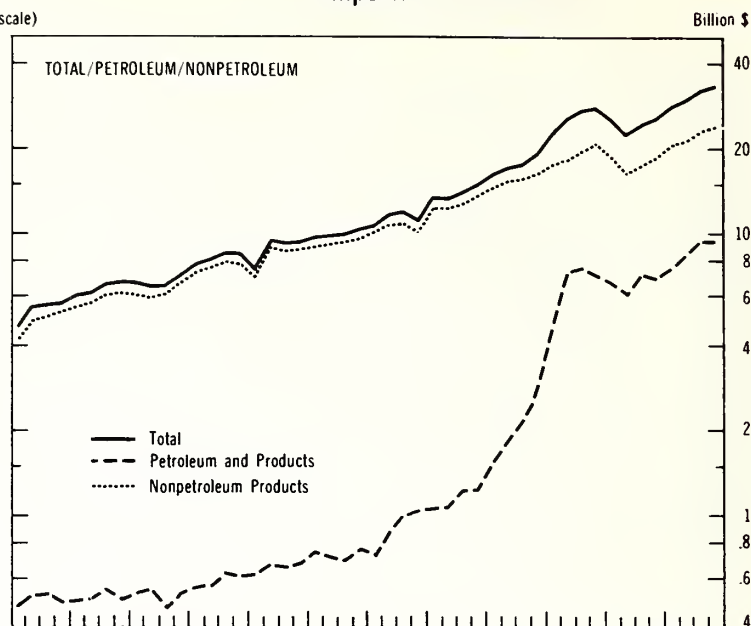

The constant dollar historical series, unadjusted, shown in table 3.1, was derived by dividing the current dollar unadjusted series by the unit value index. That constant dollar series was then seasonally adjusted by using the quarterly variant of the X-II program. (See above page xiv.)

The constant dollar series for total exports and imports are the sum of the end-use categories; i.e., *foods, feeds, and beverages, industrial supplies and materials, capital goods, automotive products, consumer goods*, and all other items. This summation procedure should be distorted less by weighting peculiarities than would occur in deflating total exports and imports.
